ABSTRACT

Presented are findings from California's State testing program for 1971-72 and 1972-73. The factors (variables) examined were divided into two groups: output factors, indicators of school quality such as scores on achievement tests; and input factors, factors describing the characteristics of school districts such as class size, tax rate, etc. Part I of the report provides a narrative description of the factors examined and is followed by a statistical summary of the data gathered. State averages against which school districts may compare their scores are given. Test scores for previous years are also listed. Part II of this report provides a district profile for each of the school districts in the State and includes all the factors described in Part I. Tentative indications of the quality of the educational program in each school district may be gained by comparing data from each district with data from other districts in the State. (Author/RC)

California State Testing Program 1971-72 & 1972-73

Profiles of School District Performance

Prepared by the Office of Program Evaluation and Research

This publication, which was funded under provisions of Title V of the Elementary and Secondary Education Act, was edited and prepared for photo-offset production by the Bureau of Publications, California State Department of Education, and published by the Department, 721 Capitol Mall, Sacramento, California 95814.

Printed by the Office of State Printing
and distributed under the provisions
of the Library Distribution Act
1974

Foreword

Significant progress was achieved during the 1972 legislative session in changing the state testing requirements. As a result of this legislative action, the information from the testing program will be more useful in helping us improve instruction for each child in California. As the program is revamped over the next few years in accordance with that legislation and the test findings, it will be focused more directly on the instructional aims of California schools. Costs will be shifted to the state to allow school districts to expand and redirect their own assessment programs, with emphasis upon the diagnosis of individual weaknesses. Comprehensive and useful information will be made available for detecting and correcting weaknesses in instructional programs. The one-score test evaluation, as provided under the previous testing program, has not given us the specific information we need to improve instructional programs.

This fourth annual report of test results for each school district represents substantial improvement over previous reports. For the first time, 1970 U.S. census data are utilized in test score prediction. In addition, by including data for the 1972-73 school year in this publication, we have reduced the interval needed to analyze and publish test results by one year. The earlier publishing of results will increase the value of this report.

I am concerned that we conduct the state testing program in the most effective manner possible and that we use the results of the program to improve the education of our children. I enlist your cooperation and assistance as we work to remold this testing program so that it can fulfill its role in improving education in California.

Superintendent of Public Instruction

Preface

This report presents the results of California's mandated testing program for the school years 1971-72 and 1972-73, fulfilling the requirement of Education Code Section 12848 regarding the reporting of test scores and other operational factors on a district-by-district basis. It provides test scores indicating the achievement levels of pupils in grades one, two, three, six, and twelve, as well as information pertaining to other operational factors for each school district. This is the fourth such report that has been prepared by the Department of Education.

An initial attempt to derive an "expected" level of test performance for each school district was first presented in Part III of the report for 1969-70. The basic idea is to predict mathematically the test scores for each district based on a knowledge of the social and economic characteristics of each district. The predicted scores can then serve as a *norm* or *expectancy* against which the actual scores can be evaluated. The relationship of the predicted scores to the actual scores is judged to be a more useful indicator of the effectiveness of a program than the actual test scores themselves.

In this fourth annual report, data from the U.S. census of 1970 are utilized for the first time as an aid in predicting test scores. By the inclusion of data for 1971-72 and 1972-73, the report reduces by one year the lag in publishing test results. The predicted scores for the year 1972-73 and guidelines for their use and interpretation are presented in this publication.

This report is presented in two parts. Part I provides a summary of the 1972-73 data on a statewide basis and a description of each of the variables used. Part II presents a profile of this information for each school district in California. Districts are listed alphabetically within counties.

For those interested in more technical aspects of the statistical analyses, a separate publication, *California State Testing Program, 1971-72 and 1972-73, Technical Supplement*, is available upon request.

Introduction to the Report on the California State Testing Program, 1971-72 and 1972-73

The objectives of the statewide testing program, as amended in 1972, are outlined in Education Code Section 12821 as follows:

It is the intent of the Legislature in enacting this chapter to determine the effectiveness of school districts and schools in assisting pupils to master the fundamental educational skills towards which instruction is directed. The program of statewide testing shall provide the public, the Legislature, and school districts evaluative information regarding the various levels of proficiency achieved by different groups of pupils of varying socioeconomic backgrounds, so that the Legislature and individual school districts may allocate educational resources in a manner to assure the maximum educational opportunity for all pupils. The program of statewide testing shall identify unusual success or failure and the factors which appear to be responsible, so that appropriate action may be taken at the district and state level to obtain the highest quality education for all public school pupils.

The reader will note that certain aspects of these objectives relate to the functions and operations of the state and that other aspects pertain more directly to the operations of school districts. In both cases the role of the testing program is to provide information about the achievement level of the pupils in California public schools in certain subject areas. Such information should be helpful to policymakers and administrators at both local and state levels in their efforts to make the public school programs more effective. The basic purpose of this report is to supply some of that necessary information.

For the district administrator who wishes to interpret his own district's scores, this report should provide additional perspective by giving statewide averages for test scores in limited subject areas. The listing of statewide values for other school factors should help districts to locate other school districts with similar characteristics and to understand and explain the interrelationships between student achievement and certain district characteristics. This information should assist districts in interpreting the results for their school boards and their communities.

Limitations of the Report

The chief limitation of this report is that it presents and analyzes pupil achievement only as indicated by scores on

standardized achievement tests. The tests selected for use in the state testing program cover only reading, mathematics, language, and spelling, and even in these areas only a sampling of the many skills that could be appropriately tested was attempted. Districts with unique needs that emphasize skills not emphasized in the test would be at a distinct disadvantage if skills were evaluated solely on the basis of the state testing program. Major subject areas such as foreign languages, geography, history, science, and social science were not tested in this program. Neither are such areas as art, career education, citizenship, environmental awareness, music, or problem solving a part of the existing assessment program.

The goals of education are complex, and standardized tests are available to measure only a few of those goals. Standardized test scores should not be the only criteria used to evaluate a total educational program; but to the extent that the tests used measure objectives of the program, they represent valid measures for those objectives and are meaningful indicators of achievement.

Evaluation of a program implies more than measurement. Evaluation implies looking at measurement in the light of objectives and costs and making decisions about the value of the outcomes obtained. Some of the information that is required for the evaluation process is provided in this report.

Structure of the Report

Part I of this report provides a narrative description of the factors examined in California's statewide testing program for 1971-72 and 1972-73 and is followed by a statistical summary of the data gathered. The summary provides state averages against which school districts may compare their scores. Test scores for previous years are also presented.

Part II of this report provides a district profile for each of the school districts in the state and includes all of the variables described in Part I.

The data are presented and analyzed in a number of ways. Each presentation is designed to shed light on this question: "How well are the pupils in each district doing?" This question implies that it is possible to compare the performance of pupils in each school district with some absolute criteria that yield precise descriptions

of quality. However, such absolute standards for describing pupil performance in each school district have not yet been developed. In lieu of such standards, tentative indications of the quality of the educational program in each school district may be gained by comparing data from each district with data from other districts in the state.

Summary of the Report

This report presents the findings from California's state testing program for 1971-72 and 1972-73. The factors (variables) examined in the study were divided into two groups for the analyses: (1) the 11 indicators of school quality in terms of the products of the educational system, referred to as output factors (e.g., pupil scores on achievement tests); and (2) the 23 factors describing the characteristics of school districts, referred to as input factors (e.g., assessed valuation, class size, tax rate, percent of college-educated males, and teachers' salaries). Complete descriptions of these factors are given in Part I of this report.

For comparison the factors are presented first in Table 1 in terms of statewide averages for 1971-72 and 1972-73 and then in Table 2 for 1971-72 and 1972-73 by type of school district organization: unified, elementary, or high school. A comparison of data from the three types of school districts shows that, in comparison with statewide averages, (1) unified districts tend to have larger enrollments, higher teacher salaries, larger classes, higher tax rates, and higher achievement scores in grades one through six; (2) elementary districts tend to have smaller enrollments, lower teacher salaries, and lower expenditures per pupil; and (3) high school districts tend to have higher teacher

salaries, higher assessed valuations per pupil, and greater instructional expenditures per pupil.

Achievement test scores for 1971-72 and 1972-73, as shown in Table 1, indicate a slight but consistent gain in reading for grades one, two, and three. Grade six showed slight gains in all subjects tested except spelling.

For grade twelve a small but consistent loss is found in all subjects tested. Other school factors remained fairly stable although there were approximate gains of 5 percent in teacher salaries and 7 percent in expenditures per pupil. There was a slight increase in the index of family poverty and pupil mobility and a slight drop in scholastic ability scores.

Part II of this report presents statewide testing data and other factors for 1971-72 and 1972-73 for each school district in California. This information makes it possible to compare the data for one school district with those of all other districts or with sets of districts having similar characteristics.

An analysis of the overall relationships among the factors examined shows that high pupil achievement scores are correlated with low rates of family poverty. High achievement scores are also associated with high expenditures per pupil, low percents of minority group pupils, low rates of pupil mobility, and higher income and education levels of the district population.

Based on these relationships, equations were developed which were used to obtain predicted test scores for each school district. The degree to which the actual scores of each district exceeded or fell short of the predicted scores is presented for each district in Part II.

California State Testing Program, 1971-72 and 1972-73

Part I

A Statewide Analysis

3/4

Description of Factors Examined in the Study

The school district factors examined in this study have been placed in two discrete groups: the products of the educational system and the characteristics of the school districts. The first group describes the skills and competencies of the pupils after some period of instruction as measured by the achievement tests adopted for use by the State Board of Education. These factors are the median achievement test scores for each school district. The achievement tests were administered to all pupils in grades one, two, three, six, and twelve during the 1971-72 and 1972-73 school years. These test score factors are alternately referred to as output, outcome, or criterion factors because they indicate the quality of the output of the schools or the criteria by which the schools are evaluated.

The second group of factors describes each school district in terms of its financial characteristics, community characteristics, and pupil characteristics. Most of the data for the factors were collected by the Department of Education in the normal course of its activities. Additional data on socioeconomic factors in each district were obtained from the 1970 census. Some examples of these factors are tax rate, assessed valuation per pupil, class size, teachers' salaries, education, and income of each school district. These factors are also referred to as "input" factors in this study, since they indicate the quality and magnitude of the input or resources which each school district is willing and able to bring to bear upon its educational problems. Some of these are referred to as *predictor* variables because they are used to predict or estimate the median test scores for each district.

The term *variable* is often used interchangeably with *factor*. Either term applies to an item of information about a school district—either a test score or one of the other characteristics of school districts.

Description of Achievement Tests Used in the State Testing Program—Outcome Factors

The following descriptions apply to the achievement tests administered to all pupils in grades one, two, three, six, and twelve during the 1971-72 and 1972-73 school years. The tests were

published by major companies and are used in various school districts throughout the country. It would be necessary to inspect each test carefully to understand fully the types of skills being assessed. However, the brief descriptions that follow give a general indication of the skills required for success on each test.

Tests for Grades One, Two, and Three

The *Cooperative Primary Reading Tests*, forms 12A, 23A, and 23B, which were selected for grades one, two, and three, survey the pupil's understanding of the basic concepts he needs for developing reading skills. They test his ability to comprehend as well as his skill to remember and to make comparisons. Each of the 50 items on each test requires the pupil to read a word, sentence, or paragraph and then mark a response from among three choices. The vocabulary of the test is geared to standard primary reading programs and most instructional materials.

Tests for Grade Six

The *Comprehensive Tests of Basic Skills*, Form Q, Level 2, was the battery selected for use in grade six. Eight subtests of this battery have been adopted for use in the state testing program. All items in the various subtests are of the multiple-choice type, with either four or five choices for each item.

Reading (Test 1, Reading Vocabulary; and Test 2, Reading Comprehension). The Reading Vocabulary test consists of 40 items which test the pupil's understanding of the meaning of underlined words presented in short statements. The pupil chooses, from among four alternatives, the word which has the closest meaning to the underlined word.

The Reading Comprehension test consists of 45 items designed to measure the pupil's ability to recognize stated details; to comprehend the ideas presented; to interpret by identifying main ideas, perceiving relationships, drawing conclusions, and making inferences; and to extend interpretations beyond the statements provided. The test uses articles, stories, poems, and letters as the bases for the test items.

A total reading score is obtained by adding the number of correct responses gained on each subtest. Only the total score is reported to the State Department of Education.

Language (Test 3, Language Mechanics; Test 4, Language Expression; and Test 5, Spelling). The Language Mechanics test consists of 25 items designed to measure the pupil's ability to punctuate and capitalize. Ability to punctuate is tested by having the pupil decide whether punctuation marks are needed within a letter and an article. School activities. Capitalization is measured in two stories in which each sentence is divided into four parts. The pupil indicates which sentence part, if any, has a capitalization error.

The Language Expression test presents 30 items related to short sentences, stories, and a poem in which words or phrases are omitted. The pupil indicates which words or phrases among the alternatives available he would select to "fit best" the form and sense of the statement. The Spelling test consists of 30 items, each presenting four words. The pupil indicates which, if any, of the alternatives are spelled incorrectly.

A total language score is obtained by adding the number of correct responses gained on each test. The total score is reported to the State Department of Education and, in addition, the scores of the Spelling test are reported separately.

Arithmetic (Test 6, Arithmetic Computation; Test 7, Arithmetic Concepts; and Test 8, Arithmetic Applications). The Arithmetic Computation test presents 48 items equally distributed among the four fundamental processes of addition, subtraction, multiplication, and division. They involve whole numbers, fractions, decimal fractions, and mixed numbers. The items are arranged to test each pupil in each process, regardless of his speed of performance.

The Arithmetic Concepts test consists of 30 items which measure the pupil's ability to recognize and/or apply appropriate concepts and techniques in order to demonstrate his comprehension of various numerical concepts and interrelationships. These items go beyond the four fundamental processes and explore concepts involved in measurement (money, time, length, volume, temperature), algebra, geometry, statistics, and logic.

The Arithmetic Applications test presents 20 items in which the emphasis is on problem solving. Word problems are presented to

test the pupil's ability to comprehend the problem, to select an appropriate method for solving the problem, to reorganize the available facts, and to solve the problem by arriving at a correct answer. The responses available to the pupil may not require him to solve the problem but may only ask him to indicate how he would solve it.

A total arithmetic computation score is obtained by adding the total number of correct responses gained on all three of these arithmetic tests, and only this total score is reported to the State Department of Education.

Tests for Grade Twelve

The *Iowa Tests of Educational Development*, Form X-4, Class Period Version, was selected for the statewide testing program in grade twelve. Three of the tests from this battery have been adopted for use in the state testing program.

Language and Spelling (Test 3, Correctness and Appropriateness of Expression). This test explores the pupil's mastery of some of the basic skills needed for effective writing: punctuation, usage, capitalization, spelling, diction, phraseology, and organization. The 79 items in the first part of the test present a letter and three short passages which might have been written by a high school student. The student's task is to determine if underlined words or sections are correct or if they should be replaced by one of three available alternatives. The examples present errors and inappropriate expressions, and the student is required to demonstrate his abilities rather than to state formal rules and principles.

The second part of this test presents 60 words in 15 questions representing the most common types of spelling problems or errors. Scores are reported to the State Department of Education for the total test and for the spelling section separately.

Arithmetic (Test 4, Ability to Do Quantitative Thinking). This test presents 33 practical problem situations which most would agree high school graduates should be able to solve. Because of its concern with practical problems, the test has implications for the guidance of pupils regarding several curricular areas, particularly in the natural sciences and the social sciences. However, it also offers a measure of general aptitude for the study of mathematics. It covers basic computational skills involving whole numbers, fractions, and decimals; and the pupil's ability to apply those skills in

problem-solving situations involving such concerns as volume, area, measurements, proportions, formulas, roots and powers, cost and profits, and approximation. It involves the interpretation of linear interpolations, symbols, graphs, tables, and charts.

Reading (Test 5, Ability to Interpret Reading Materials in the Social Studies). This test assesses the student's ability to interpret and evaluate reading matter representative of textbooks, reference books, periodical articles, and newspaper items dealing with social problems and social studies in general. The student is not merely asked to assimilate the ideas presented, but he is also asked to comprehend the implications and interrelationships of the ideas and to evaluate the authors' approaches and handling of the topics.

Eight passages dealing with geography, sociology, contemporary social problems, economics, political science, and history are presented. They are loosely organized, with the most important thoughts often implied rather than stated explicitly. The 53 questions which accompany these passages frequently require the student to make qualitative, subjective judgments.

Description of School District Characteristics Examined in the Study of the State Testing Program - Input Factors

In addition to the achievement test scores, Education Code Section 12848 requires the reporting of several input factors that are descriptive of the school district and its operation. This information may be used to gain a better understanding of the conditions under which a district operates and thus a better basis for interpreting the output factors, or test scores. A description of each of the district and pupil characteristics used in this report and the method of calculation are presented in the paragraphs that follow.

Median Salaries Paid to Teachers

Data on median teachers' salaries in 1971-72 and 1972-73 were derived from information collected from each district by the Bureau of School Apportionments and Reports, California State Department of Education (Form R-1). This form requests data based on a frequency distribution of salaries actually paid to teachers, with a lower interval of under \$7,200 and a top interval of \$16,200 and over. Each interval has a range of \$300. The

median salary was calculated for each school district according to this distribution.

Average Class Size, Kindergarten Through Grade Eight

Information on average class size in kindergarten through grade eight is collected annually by the Bureau of School Apportionments and Reports, California State Department of Education (Form J-111). The average number of pupils per class is rounded to one decimal place.

Average Class Size, Grades Nine Through Twelve

Information on average class size in grades nine through twelve is also collected annually by the Bureau of School Apportionments and Reports (Form J-111). The average number of pupils enrolled per full-time-equivalent classroom teacher in each school district is rounded to one decimal place.

Total General Purpose Tax Rate

The total general purpose tax rate was taken from information collected from each school district on Form J-29B and summarized by the Bureau of School Apportionments and Reports. It includes the areawide tax when levied. In the few cases in which a school district reported permissive override tax rates but was not levying a general purpose tax at the legal tax rate limit, the permissive override tax rates were considered part of the general purpose tax rate to the extent of the legal tax rate limit.

Assessed Valuation per Unit of Average Daily Attendance

To compute the assessed valuation per unit of a.d.a., the Office of Program Evaluation and Research divided the modified assessed valuation for each school district by the total regular a.d.a. in grades one through twelve. This factor was calculated to the nearest dollar. The regular a.d.a. was used in the calculation because it is a figure derived from sources common to all school districts. The total a.d.a. was not used because of the wide variation among districts in the operation of summer schools, continuation schools, and adult classes.

Percent of Minority Pupils

In this report the minority enrollment in the district was divided by the total enrollment to obtain the percent of minority

enrollment. In addition, a breakdown of the racial and ethnic composition of the district is given for the categories of Negro, Spanish-surname, Oriental, and American Indian. A breakdown for the classification "other nonwhite" is not given since these pupils usually comprise less than one percent of the district enrollment. The sum of the percents for the individual minority groups may not always add to the total percent because of independent rounding to one decimal place for each group and the exclusion of "other nonwhite" pupils. It may be noted that data for percent of minority enrollment are reported only for 1971-72. These data were not collected for the 1972-73 school year.

Index of Family Poverty

The index of family poverty was derived by dividing the figure for the total funds which a school district was entitled to receive under Title I of the Elementary and Secondary Education Act of 1965 (Public Law 89-10, as amended) by the average daily attendance figure (less adults) of the district. The index of family poverty, as calculated from the ESEA, Title I, entitlement rather than from expenditures, has the advantage of not being affected by districts that (1) did not submit ESEA, Title I, projects; (2) submitted projects for less than their entitlement; or (3) spent less than the amount approved on a project. It provides a computational basis for determined poverty conditions of a school district without being influenced by the actions of the district.

Scholastic Ability

The median IQ scores were based on the *Lorge-Thorndike Intelligence Tests-Verbal Battery*, which was administered to pupils in grades six and twelve. These tests, published by Houghton Mifflin Company, yield IQs ranging from 50 to 151 for grade six (Form 1, Level D) and from 50 to 150 for grade twelve (Form 1, Level G). The median IQ score computed to one decimal place was used as the measure of average scholastic ability for the pupils in each school district.

These tests were designed to measure abstract intelligence defined as "the ability to work with ideas and the relationships among ideas."

The verbal battery consists of five tests:

1. The items in the vocabulary test require the examinee to choose from five words the one that has most nearly the same meaning as the given word (stem).
2. The sentence completion test requires the examinee to choose the one word out of five that best completes a sentence.
3. The arithmetic reasoning test presents short story problems. The examinee is to choose the correct answer from five alternatives, one of which is always "none of these."
4. The verbal classification items present a series of three words, and the examinee is to choose the one of five additional words that belongs with the original series.
5. The verbal analogy test is composed of items that present three words. The first two words are related to each other in some way, and the examinee is to choose which one of five answers is related to the third word in the same way.

Pupil Mobility

The pupil mobility (transitory) factors were derived by dividing the average daily attendance of the school district by the total annual enrollment of the district. Two transitory factors were computed for all school districts. The factors were based upon regular day class a.d.a. and total annual enrollment for the two grade-level groups: one through eight and nine through twelve. These data are collected on the annual report of attendance forms: J-18A for elementary grades; J-19EA, grades seven and eight; and J-19A, grades nine through twelve. The transitory factor for each grade-level group is the result of dividing the a.d.a. by the total enrollment. The total annual enrollment was defined as the count of pupils entered on the roll for regular classes during the course of the school year. Since pupils changing schools within a district were counted each time they enrolled in a different school, the factor includes intradistrict mobility as well as interdistrict mobility.

Expenditures for Instruction

Expenditures for instruction per unit of average daily attendance were computed by dividing the expenditures of each school district (Item 200, Total Instruction, on Form J-41, Annual

Financial and Budget Report) by the a.d.a. for that district. The factor was rounded to the nearest dollar.

Regular Average Daily Attendance

The total regular a.d.a. figures were taken from the annual reports of attendance forms: J-18A, elementary districts; J-19EA, grades seven and eight; and J-19A, grades nine through twelve. However, the figures do not include pupils attending special education classes, summer schools, opportunity schools, continuation education classes, regional occupational centers, or classes for adults.

Census Variables

Six census variables were used for each school district to indicate its status. These census variables were also included in the regression equation to predict the achievement scores for each district. The census information for each district was derived from Fourth Count Population Summary Tape tallies of the U.S. Bureau of the Census described in the *1970 Census Users' Guide*.¹ The Bureau of the Census surveyed information by census tract and Census County Division (CCD). The census tract and CCD geographical boundaries are not the same as school districts' boundaries. Therefore, to derive information for a particular variable for a district, the census tract and CCD information was aggregated to approximate the entire district. The six census variables used in this report are described in the following paragraphs. Further descriptions of these variables can be found in the *1970 Census of Population: General Social and Economic Characteristics, California*.²

Percent Spanish Language

Tabulation 24 of the *1970 Census Users' Guide*, entitled "Spanish Indicators," lists the count of persons of "Spanish language," and several other indicators. The corresponding aggregate for each district was divided by the total population in the district and then converted to percents. As an example, a value of

¹ *1970 Census Users' Guide*, Part II. Prepared by the U.S. Bureau of the Census, Washington, D.C.: U.S. Government Printing Office, 1970.

² *1970 Census of Population: General Social and Economic Characteristics—California*. Prepared by the U.S. Bureau of the Census, Washington, D.C.: U.S. Government Printing Office, 1972.

15 on this variable indicates that 15 percent of the population of the district is estimated to belong to the Spanish language category.

Percent College-Educated Males

Tabulation 42 of the *1970 Census Users' Guide*, entitled "Population 25 Years and Over by Years of School Completed and Sex," gives the number of males age twenty-five or over who completed five or more years of college. This population category is referred to as "college-educated males." The district aggregate of college-educated males was divided by the total district population and expressed as a percent.

Percent College-Educated Females

Tabulation 42 of the *1970 Census Users' Guide* also lists the number of females age twenty-five or over who completed five or more years of college. This population category is referred to as "college-educated females." The district percent of college-educated females was derived for each district in the same way as for males.

Median Income, Male Professionals

Tabulation 78 of the *1970 Census Users' Guide*, entitled "Males 16 Years Old and Over in the Experienced Civilian Labor Force by Earnings and Occupation," gives information on median income of experienced civilian males age sixteen or older who constituted professional, managerial, or kindred workers. This population category is referred to as "median income—male professionals" as reported for each school district.

Median Income, Male Operatives

Tabulation 78 of the *1970 Census Users' Guide* also gives information on median income of experienced civilian males age sixteen or older who constituted operatives (including transport). This population category is referred to as "median income—male operatives" as reported for each school district.

Median Income—All Males

Tabulation 78 of the *1970 Census Users' Guide* also gives information on the total population of males age sixteen or older in the experienced civilian labor force. This population is referred to as "median income—all males," as reported for each district.

Statewide Findings

The data presented in Table 1 were obtained by using the district median test score, index, or value for each factor and calculating the statewide average (mean) for each factor. This provides a yardstick against which districts may compare their own median scores or by which differences among unified, elementary, and high school districts may be observed. Since the test score averages were calculated from district medians, they do not necessarily match state averages from other studies that use student scores as a base.

Examination of the achievement test scores in Table 1 will show that from 1971-72 to 1972-73 there was a slight rise in district scores in reading for grades one, two, three, and all testing areas of grade six except spelling. Grade twelve scores were down in all areas of testing from 1971-72. These trends in scores are shown in more detail in tables 3 through 7, which deal with averages based upon individual student scores.

The items listed under Other School Factors in Table 1 provide descriptive information useful in locating districts that have similar characteristics and thus can be properly compared, or in identifying district characteristics that may influence the anticipated achievement level of the district's pupils.

Teacher salary data reflect actual salaries paid rather than the adopted salary schedule ranges. The mean of district median teacher salaries rose to \$10,619.73, a 4.6 percent increase over 1971-72.

Average class size in kindergarten through grade eight was 24.71, while the average class size in grades nine through twelve was 24.81, both reflecting slight decreases from the previous year.

The general purpose tax rate went up 1.9 percent to \$2.19. The average assessed valuation per unit of a.d.a. was \$46,450.65, a rise of 7.4 percent.

Scholastic aptitude scores dropped very slightly, leaving an average score of 95.79 for grade six and 97.97 for grade twelve. The pupil mobility factor in grades nine through twelve remained at 0.86 and in grades one through eight remained at 0.84. Average expenditure per unit of a.d.a. rose 7 percent to \$678.58, and regular a.d.a. fell almost 1 percent to 3,697.68.

Table 2 displays the same data as does Table 1, but it is broken down by the type of district organization: unified, elementary,

and high school. It can be seen in Table 2 that, in comparison with state averages, unified school districts tend to have larger pupil enrollments, larger classes, and higher achievement scores in grades one through six. They also have higher teacher salaries and higher tax rates than the state averages. Elementary school districts have smaller enrollments, lower expenditures per pupil, and lower teacher salaries. High school districts tend to have higher achievement salaries, higher assessed valuation per pupil, higher achievement scores in grade twelve, and higher expenditures per pupil than state averages. It can be stated generally, however, that among the three types of districts, differences in pupil achievement and ability were slight when compared to differences in monetary variables such as tax rate, expenditures, and salaries.

Tables 3 through 7 were developed by tabulating the frequency distributions of student scores submitted by districts into a single frequency distribution for each test and grade level. This same procedure has been followed each year, so the results can be charted to show change over the years. Since these tables were derived from student scores, these student median scores are not comparable to the district mean scores in tables 1 and 2.

Grades One, Two, and Three

The Miller-Unruh Basic Reading Act of 1965 (Education Code Section 5779) specifies that uniform tests to determine achievement of basic reading fundamentals and skills shall be administered to all pupils completing the first, second, and third grades. By law, this testing program was initiated in grades one and two in May of 1966 and was expanded to include grade three pupils in May of 1967. Originally, the *Stanford Reading Test* was administered to primary pupils each May. That test was replaced by the *Cooperative Primary Reading Test* at grade one in 1970, grade two in 1971, and at grade three in May of 1972.

In reporting the results of these tests each year, the State Department of Education has reviewed the results of previous years in order to monitor the progress of the pupils in our public schools. Care must be taken, however, in comparing the results obtained in different years when different tests were employed. The *Stanford Reading Test* and the *Cooperative Primary Reading Test* differ to varying degrees in terms of their curricular content,

the types or levels of skills tested, and the national samples used to validate and norm the tests. The presentation of historical data, even though it involves different tests, allows the reader to see that trends established with the *Stanford Reading Test* are continued with the *Cooperative Primary Reading Test*.

Results of the Tests

The data in Table 3 indicate that California pupils in grade one scored very low on the *Stanford Reading Test* from 1966 through 1969 when compared with the publisher's norms.³ However, during this period consistent though modest improvement was realized each year. With the introduction of the *Cooperative Primary Reading Test* in 1970, California's median score for pupils in grade one fell only slightly below the publisher's median. Continued use of this test in 1971 indicated that pupils in the first grade were continuing to demonstrate consistent though modest increases in their test scores, and for that year they exceeded the publisher's median by one percentile point. In 1972, the median score for California pupils in grade one exceeded the publisher's median by five percentile points. The gradual upward trend in raw scores continued in 1973 but did not change the percentile rank of the median score.

The data in Table 4 present much the same picture for test results for grade two as was experienced with grade one. The results obtained on the *Stanford Reading Test* from 1966 through 1970 were low when compared with the publisher's norms, although consistently but modestly improving during the period. The change in 1971 to the *Cooperative Primary Reading Test* resulted in a median score that was at the publisher's norm for the second grade. In 1972 test scores continued their modest but consistent rise, and the median score exceeded the publisher's

³Publishers' national norms are derived independently for each test by the individual publisher. The degree to which a publisher's "national" norm is actually representative of all pupils in the United States depends on (1) the statistical techniques used to draw the sample; and (2) the level of cooperation the publisher receives when he invites the schools to be a part of his norming sample by administering his test to all or a sample of their pupils. It is inevitable that such a process leads to a certain amount of bias in each of the norming samples so that a group of pupils may appear to be performing much better, according to "national" norms, on one test than on another. Unfortunately, there is no "national" norm that is independent of a particular test or that can be used to adjust or equate the results from different tests. The consumer of test results must be extremely careful in interpreting performance in terms of "national norms."

norms by three percentile points. The 1973 test results were slightly higher than those of 1972, but the 1973 results did not change the percentile rank score.

Table 5 presents test data for pupils in grade three from 1967 through 1973. Again the data indicate that California pupils scored at levels considerably below the publisher's norm group on the *Stanford Reading Test*, but there was consistent though modest improvement each year. In May, 1972, the *Cooperative Primary Reading Test* was used for the first time in grade three. The median score for California's pupils in third grade was two percentile points above the publisher's norms for this test. The differences in the test scores for pupils in grade three between 1972 and 1973 are slight, but the 1973 scores have maintained the upward trend.

Grades Six and Twelve

In accord with the requirements of the California School Testing Act of 1969, the State Board of Education established a statewide testing program involving pupils in grades six and twelve to provide annual measures of academic achievement and scholastic aptitude. The achievement tests adopted by the Board to be administered for the first time in these grades in the fall of 1969 were as follows:

Grade six—*Comprehensive Test of Basic Skills* (CTBS)

Grade twelve—Iowa *Test of Educational Development* (ITED)

Both of these batteries of tests provided measurements of pupil achievement in reading, language, spelling, and arithmetic (mathematics). Prior to 1969 the only achievement tests administered statewide to sixth-grade pupils dealt with reading, and twelfth-grade pupils were not included in the state testing program.

Measures of scholastic aptitude at grades six and twelve were obtained by means of the *Lorge-Thorndike Intelligence Tests, Verbal Battery*. Although this same test has been used statewide with sixth-grade pupils since 1966, it was used statewide with twelfth-grade pupils for the first time in the fall of 1969.

Results of the Tests

The results of the scholastic aptitude and academic achievement testing in 1971 and 1972 are presented, in summary form, in Table 6 (grade six) and Table 7 (grade twelve).

The data in Table 6 indicate that in 1972, California pupils in grade six scored slightly below the publishers' norms on all tests. The fall, 1972, scholastic aptitude scores decreased modestly at each of the quartile points. These changes resulted in declines in percentile ranks at the median and at the seventy-fifth percentile. Raw scores in the basic skills areas of reading, language, and mathematics increased slightly at all of the quartile points. Although the differences are slight, they may indicate a reversal of the downward trend recorded during the past three years. The

greatest increases were at the twenty-fifth percentile in reading and mathematics. In most cases the modest changes in scores are not reflected in changes of percentile ranks or grade equivalents.

The data in Table 7 indicate that in 1972, California students in grade twelve continued to perform below the publishers' norms in both scholastic aptitude and the basic skills. Fall, 1972, scholastic aptitude scores and raw scores in the basic skills areas declined at all of the quartile points. In reading and language (expression), this decline is reflected in a decrease in the percentile ranks.

TABLE 1
Statistical Description of All California School Districts in Terms of Scores Obtained from the
California State Testing Program and Other School Factors, 1971-72 and 1972-73

Variable	1971-72		1972-73

California State Testing Program, 1971-72 and 1972-73

Part II

Profiles of School District Performance

California State Testing Program, 1971-72 and 1972-73 - Overlay

This overlay may be used as a guide in identifying the factors presented in Table 8 (starting on page 28) for individual school districts. See pages 5-9 for more detailed descriptions of the factors and pages 25-26 for an explanation of the columns.

This is the school district to which the data below apply. Position this open area on the space containing the district name for Table 8.

These are the median raw scores (number of questions answered correctly) in grade one for this district for 1971-72 and 1972-73.

These are the percents of all California school districts which had lower median reading raw scores in grade one in 1971-72 and 1972-73 than this district.

This is the range of scores most likely to be obtained by a district with its input characteristics. One-half of all similar districts obtained scores within this range; one-fourth obtained scores below this range; and one-fourth obtained scores above this range. Those factors used in the prediction are printed in *italics*.

This Performance Index identifies scores below the predicted range with a *B*, those within the range with a *W*, and those above the range with an *A*.

The *O*s plotted in this area represent the predicted score intervals; the *X*s represent the percentile ranks of the 1972-73 median scores. Occasionally, the *X* for a median score which actually is outside the predicted range may appear to be within because of the necessary grouping of percentile ranks for the visual display.

These are the median salaries actually paid to teachers by the school district in 1971-72 and 1972-73.

These are the state percentile ranks of the median salaries paid in 1971-72 and 1972-73.

The *A*s and *B*s in this area indicate the relative positions of the percentile ranks of the salaries for the 1971-72 school year (*A*) and the 1972-73 school year (*B*). The letter *S* has been printed where the values for the two years overlap.

These are the percents of minority group pupils enrolled in the district. The total minority percent may exceed the sum of the individual percents since the four minority group categories reported here do not necessarily include all minority group pupils.

This is the amount of ESEA, Title I, funds per unit of a.d.a. for which the district was eligible.

These are pupil mobility rates for 1971-72 and 1972-73. They might also be called stability rates, since the higher the figure (i.e., the closer to 1.0), the lower the mobility rate.

This expenditure figure includes costs for instruction only.

This is the average number of regular pupils in attendance in the district.

These are the values for the factors derived from the 1970 U.S. Census.

These are the state percentile ranks of the U.S. Census factors.

Interpretation of the Test Scores and Other School District Factors

The purpose of this report is to furnish the reader with some necessary information for making valid judgments about how effective California school districts are in meeting their obligation to instruct pupils in the basic educational skills. In Part II of the report, basic data about the input and output characteristics of each district are presented so as to make possible the comparison of any district with (1) all other school districts in California; and (2) a hypothetical set of districts that are similar to the district in question in several important ways. This last comparison could be considered a way of comparing a district with itself, which may be the most valid comparison, considering the uniqueness of each school district.

This part of the report is subdivided into three sections. The first section, entitled Judging School District Performance, presents ways in which test scores can be used to draw inferences about school district performance.

In the second section, Describing District Performance Profiles, district performance profiles are explained. The third section amplifies on the proper use of one part of the profile, the performance index. This section is headed Interpreting the Performance Index.

Judging School District Performance

Since the central purpose of this publication is to present information to assist the reader in forming judgments about the effectiveness of school district programs, it is appropriate to review the approaches that can be taken in making those judgments.

As mentioned in Part I, this report is limited to the results of standardized achievement tests of basic skills. Even within this traditional and relatively narrow, although essential, definition of school quality, the task of drawing conclusions regarding the quality of school districts by examining pupil test scores is not as simple as it might appear.

The most common method of presenting test scores for a group of pupils is to compute an average raw score, which is the average number of questions on the test which the pupils answered correctly. In pondering the quality of a given score, for example a score of 27, one soon realizes that the score in itself has no

inherent meaning. The average number (or percent) of questions answered correctly on the test is difficult to interpret by itself because of the relative difficulty of the questions within a test or between tests. For example, an average score of 10 on a difficult test may be comparable to a score of 20 on an easier test. In attempting to attach meaning to a given score, the most common practice is to compare the score for a district with the scores of other districts. The basic question, "How well is district X doing?" is restated to read "How well is district X doing in comparison to other school districts?" The inference is then made that if a district scores below most other districts, it must have a poor instructional program, and, conversely, if a district scores above most other districts, it must have a good program, good teachers, and so forth.

Such inferences may or may not be valid. To compare a district with other districts without regard for the characteristics of the district is often meaningless and sometimes misleading. It is more useful to compare a district with similar districts in terms of social, financial, and educational problems and capabilities.

The tables presented in this report enable the reader to evaluate the performance of a district by comparing it with that of other districts at two levels of precision: (1) all other districts in California; and (2) sets of similar districts (hypothetical), matched by a mathematical model on several input variables simultaneously. The two levels are briefly described in the paragraphs that follow.

1. *All California school districts.* At the lowest level of generality, one can compare the median test score for a district with the average for all districts as found in Table 1 of this report. The score can also be compared to the average for a given type of district (unified, elementary, or high school) as found in Table 2. At about the same level of generality, but somewhat more precise, are the percentile rank values found in Table 8. These percentile ranks indicate the percent of all California school districts that scored below the average score of any given district.

2. *Sets of similar districts (hypothetical) (districts matched on several input variables simultaneously).* One limitation of grouping districts on one input variable at a time for comparison purposes is that the reader may find it difficult to generalize across several

comparisons to form a conclusion about the relative quality of a district's performance. A technique is needed which can combine these separate comparisons into a combined weighted comparison. The technique used in this report is to estimate or predict, from knowledge of other characteristics about a school district, the average test score the district is most likely to obtain. The relationship of the obtained score to the predicted score, which is known as the performance index, can serve as a more appropriate measure of performance or quality. In one sense it can be said that, in this approach, each district is being compared against itself or, more accurately, against a hypothetical set of districts with similar characteristics. The derivation of the performance index is described in the section entitled Describing District Performance Profiles. Some appropriate uses of the index are discussed in the last section, entitled Interpreting the Performance Index.

Each of these approaches or levels of comparison may lead to slightly different interpretations. Perhaps the most valid interpretation might be based on a consideration of both approaches.

Describing District Performance Profiles

Performance profiles are presented for individual districts in Table 8. Information for two school districts is presented on each page, and districts are arranged alphabetically by county. On the left side of each page, 11 test score (output) factors are listed first; then 23 district characteristic (input) factors are listed. Those factors used to predict test scores are printed in italics in Table 8. Each of these factors (variables) is defined in Part I of this report. Information includes input and output values, percentile ranks, and graphic representations of the ranks for each district for each of the variables. Specific descriptions of each item of information and terms used are given in the paragraphs following.

District Median Scores; District Values

For the test score (output) factors, the district average used is the median (midpoint) test score for all pupils in the district at that grade level. For the input factors, the district value is a number of dollars, a ratio, a percentage, or whatever descriptive form is used to describe the data. Actual values for both years are given so that changes that have occurred can be observed easily.

State Percentile Ranks of District Median Scores or District Values

The figures in the columns for district median scores are percentile ranks, which indicate how a district compares with all other districts in California having data for that factor. Since information on some factors was not available for all districts, the number of districts involved in the comparison varies, but it can be determined by consulting Table 1 in this report. These percentile ranks indicate the percent of school districts that have a district factor (variable) value below that of a particular district. For example, if district A has a percentile rank of 42 for "median teacher salary," it means that the median salaries paid by 42 percent of all districts are below that of district A. Percentile ranks range from 1 through 99. The scores for each factor are arranged so that districts with high scores or high values for a given factor ranked high (near 99), and districts with low values ranked low (near 1). The meaning of high and low ranks for all factors is indicated in Chart 1.

Percentile ranks are presented for both 1971-72 and 1972-73. Each rank indicates the position of the district value in relation to all districts *for that year*. For example, a percentile rank value of 24 in 1971-72 for first-grade reading indicates that the district median score exceeded the scores for 24 percent of all districts in 1971-72; a percentile rank value of 23 for 1972-73 indicates that the district median exceeded the scores for 23 percent of the districts in 1972-73. For factors on which all districts tended to shift in one direction, it is possible for a district to experience a slight change in obtained value but no corresponding change in the percentile rank. For example, although the median reading score for grade three for a district may be slightly higher in 1972-73 than in 1971-72, the percentile rank for the district may remain the same, since there was a general statewide increase in grade three reading scores. On the other hand, a district may have an identical obtained value from 1971-72 to 1972-73 but will notice an unexpected change in percentile ranks. This will happen whenever the values for a district do not increase or decrease at the same rate at which most other districts tend to change. A comparison of ranks for both years does, therefore, indicate how the characteristics of a certain district have changed in one year in

relation to all other districts. These percentile ranks, if read in conjunction with the 1970-71 report, *California State Testing Program, 1970-71*¹ can help in the investigation of trends about a particular factor.

Special caution must be used in interpreting the percentile ranks of the test scores since they are based upon distributions of *district median scores* rather than upon tabulations of individual pupil scores.²

State Percentile Ranks of Predicted Score Ranges (Output Factors Only)

The ranks in the column for predicted score ranges represent the test score range in which each district could be "expected" to score based upon the pertinent characteristics of the pupils, the community, and the school district. A range is given because it is not possible to predict the score with great accuracy. The width of the range varies with (1) the grade level (it is more difficult to predict the scores for lower grades); and (2) with the number of pupils in the district (it is more difficult to predict the scores for smaller districts).

The statistical technique used to make the predictions is that of multiple linear regression analysis. In this procedure the weight

¹ *California State Testing Program, 1970-71: Profiles of School District Performance*. Prepared by the Office of Program Evaluation. Sacramento: California State Department of Education, 1972.

² The percentile ranks listed for the test score factors are not equivalent to those normally used by school districts in reporting test results. The percentile ranks used in this report are based upon distributions of school district averages (medians), whereas one section of the raw score-to-percentile rank conversion tables that are annually distributed by the State Department of Education is based upon frequency distributions of individual pupil scores. The variation among pupil scores is much greater than the variation among district median scores. For any given raw score, this technical difference may result in vast differences between the two kinds of percentile ranks. For low median scores, the ranks listed in this report are much lower; for high scores, they are much higher. In interpreting these ranks properly, therefore, it is important to remember that they are percentile ranks of district medians. For example, a percentile rank of 85 for a given district would mean that the average (median) for that district exceeded the medians of 85 percent of the other districts. It would be inaccurate and misleading to say that the district average (median) exceeded the performance of 85 percent of all pupils. Both methods of computing percentile ranks are equally valid. It was essential that the method based on median scores be used in this report so that the percentile ranks for the test score variables could be made equivalent in meaning and, therefore, comparable to the ranks for the other factors.

District variable (factor)	Low ranks indicate:	High ranks indicate:
Test scores	Low median scores	High median scores
Teacher salaries	Low salaries	High salaries
Average class size	Small classes	Large classes
Tax rate	Low tax rate	High tax rate
Assessed valuation per unit of a.d.a.	Low valuation	High valuation
Minority enrollment	Few minority group pupils	Many minority group pupils
Index of family poverty	Low poverty	High poverty
Scholastic ability	Low average ability	High average ability
Pupil mobility	Low mobility	High mobility
Expenditures per unit of a.d.a.	Low expenditures	High expenditures
Regular a.d.a.	Few pupils in district	Many pupils in district
Percent Spanish Language	Low percents	High percents
Percent college-educated	Low percents	High percents
Median incomes	Low incomes	High incomes

Chart 1. Meaning of high and low percentile ranks

given to each input factor in making the prediction is determined by a series of complex statistical routines with the assistance of an electronic computer. A prediction equation is obtained through use of these "best" weights, by means of which the score for each district can be predicted from the data on the factors which go in the prediction equation. The input factors which were used in the prediction equation are as follows:

1. Percent Spanish-surnamed
2. Index of family poverty
3. Pupil mobility
4. Expenditures for instruction per unit of a.d.a.
5. Percent Spanish language
6. Percent college-educated males
7. Percent college-educated females
8. Median income—male professionals
9. Median income—male operatives
10. Median income—all males

These factors are printed in italics in Table 8. It will be noted that the values used in the prediction equation for input factor 1 (percent Spanish-surnamed) is for the years 1971-72; for factors 2, 3, and 4, for the years 1972-73; and for factors 5 through 10, for the year 1970. The weight each input factor received depended primarily upon how closely it was related to the test scores. A few of the factors in the list are quite closely related to test scores and therefore are heavily weighted in the prediction equations. Most of the other factors are only moderately or slightly related to the scores and consequently add very little to the accuracy of the predictions. The criteria for selecting these factors, the weight assigned to each factor, and a detailed description of the procedures followed in making the predictions can be found in the separate technical supplement to this report.

In the evaluation of district test scores, one of the most useful ways to account for relevant district characteristics is to compare obtained scores with predicted scores. However, it must be emphasized that the predictions are *not* infallible or precise, but rather are *estimates* of scores that might be expected of districts with a given set of characteristics.

Performance Index (Output Factors Only)

The performance index is defined as the position of the obtained rank in relation to the predicted score range. This index can take the form of *A* (above), *W* (within), or *B* (below). If the obtained score is below the predicted range, a *B* is printed; if it is within the predicted range, a *W* is printed; and if it is above the predicted range, an *A* is printed. This column aids the reader in detecting trends across grade levels or subject matter areas. See Interpreting the Performance Index on this page for guidelines.

Graphic Display of the Percentile Ranks

In the graphic display the percentile ranks listed are plotted for visual inspection. The symbols used, *X*s and *O*s, are placed to indicate the approximate position of the percentile ranks according to the scale at the top of the column. The percentile ranks near the middle are closer together to match actual distributions of scores that tend to be "bunched up" near the middle. This demonstrates, for example, that scores at the fiftieth and the

fifty-fifth percentile ranks are more alike than scores at the ninetieth and the ninety-fifth percentile ranks.

Output factors. For easier analysis of the relationships between obtained scores and predicted scores, the position of each is indicated with *X*s and *O*s on the percentile rank scale. For predicted scores, the whole range is plotted. This visual display allows one to see quickly if an obtained score falls within the predicted score range or how far it falls outside the predicted score range. When the obtained score is very close to, but not quite within, the predicted score band, the display may falsely indicate an overlap of scores. In such cases, the actual ranks in the other columns are more precise. For most purposes, however, the scores are plotted as precisely as the accuracy of the predictions will justify.

Input factors. For the input factors, *A*s are printed to indicate the relative position of the 1971-72 district values. The district percentile rank values for 1972-73 are also plotted (as *B*s) to assist the reader in detecting changes. An *S* has been printed when both the percentile ranks fall on the same position on the page.

Interpreting the Performance Index

To assist the reader in forming valid conclusions about school district performance based upon the performance indices, the following guidelines are offered:

1. All performance indices (*P*I's) pertain only to the test results for the 1972-73 school year. These results should be considered as only one sampling of results, which should be compared with other samplings in past and future years.
2. The difficulty of making valid comparisons is especially great for small school districts. The actual median scores for these districts are based on a small number of pupils at each grade level and are likely to fluctuate from year to year and from grade level to grade level. Any interpretations formed for such districts must be held as extremely tentative.
3. The regression technique used in predicting test scores is less accurate at the extreme ranges than it is in the middle ranges. This is particularly true for certain predictor variables such as Poverty Index and Percent College Educated, which have relatively heavy weights in the equation. A very high or very low value on these variables may occasionally result in prediction of the highest or the lowest possible score. In such a case, it will be impossible for a

district scoring very high to obtain a performance index A and for a very low scoring district to obtain a performance index B .

4. The predictions upon which the P 's are based are not as accurate as may be desired; therefore, one is not justified in making discriminations much finer than the categories of "below expectancy," "within the range of normal expectancy," and "above expectancy."

5. The predicted or expected score is not an absolute standard or criterion. By virtue of the statistical technique used and by the placing of a band or range around the predicted scores, approximately one-fourth of all scores fall below the predicted range and one-fourth fall above the predicted range. To conclude that California schools are inferior because one-fourth of all districts score below expectancy would be to miss the point. The performance index does not demonstrate in an absolute sense how well or how poorly any school district is doing. It does indicate, however, in a relative sense, how each district is doing in comparison with other districts with similar financial, social, and educational characteristics.

6. Since any single discrepancy may not have much meaning, one should look for trends. For which particular grade levels or curricular areas are the scores generally above or below the predicted range?

7. A major aim of this report is to help school districts identify areas of strength and weakness within their instructional programs. However, before concluding that the instructional program is to be blamed for unfavorable performance indices (B s) or to be credited for favorable indices (A s) one should be sure that the predictors (input factors) accurately characterize district and community. Changing socioeconomic characteristics of a community possibly may cause distortion of the predictions. For example, a large and sudden migration of persons of a lower economic level might depress the average scores without necessarily depressing the predictors at the same rate. Conversely, the scores for a district would be artificially raised by the opening of a large research laboratory, for example, which would bring an influx of highly trained professional people whose children typically do very well in school. Some factors, such as attitudes of parents toward the schools and relationships between pupils and teachers, have not been considered, although they may be influential in determining pupil achievement. For some districts the goals of instruction may be sufficiently different from the content of the tests to warrant special interpretation of the results.

Each of these points emphasizes, mainly, that since these initial predictions are less than precise, all conclusions must be *tentative*, *suggestive*, and *exploratory* in nature.
